

# V19.4.5 Drivers

eScada.Drivers.AllenBradleyEIP

# eScada.Drivers.AllenBradleyEIP

(Ethernet IP – Connected CIP Transport)

#### **OS availability**

Windows, Linux, RaspBian

#### Atomic data type

Following CIP specifications for implemented data types.

#### Hardware and documentation reference

www.rockwellautomation.com www.odva.org Communicating with RA Products Using EtherNet/IP Explicit Messaging (Rev. 1.2)

#### Parameters available in every section

Channel:	none	

Device:	Node network	Ethernet/CNET DH+ (*)
	DH+ Channel	* Channel A, Channel B
	IP address	It can be IPV4
		Multiple addresses can be expressed separated using , (comma)
		e.g. 192.168.1.10,192.168.1.11
	TCP Port	A valid TCP port number.
	Node path	Destination node path.
		(only standard path 1,0 has been tested, even though other longer paths should work)
	Session Serial Number	It shall be a unique number for the connected device
	EIP Mode	0=Connected, 1=Unconnected
	Request Packet Interval	It must be greater than the maximum polling time
	Reconnect timeout [ms]	Waiting time before a re-connection after COMM break-down
Group:	none	

Tag: none

#### **Remarks for devices**

The following attributes can be expressed for every device.Bytes order actionsNone, Swap bytes (little endians ↔ big endians adjustment)String actionsNone, Swap bytes in words

## Implemented data types

PLC data type		Single element	HMI Array
BOOL	single bit	Yes	Yes
SINT	8 bit	Yes	Yes
INT	16 bit	Yes	Yes
DINT	32 bit	Yes	Yes
REAL	floating point 32 bit	Yes	Yes
STRING	String of bytes	Yes	No
COUNTER	structure		
.PRE	DINT, 32 bit	Yes	No
.ACC	DINT, 32 bit	Yes	No
.CU	BOOL, single bit	Yes	No
.CD	BOOL, single bit	Yes	No
.DN	BOOL, single bit	Yes	No
.OV	BOOL, single bit	Yes	No
.UN	BOOL, single bit	Yes	No
TIMER	structure		
.PRE	DINT, 32 bit	Yes	No
.ACC	DINT, 32 bit	Yes	No
.EN	BOOL, single bit	Yes	No
.TT.	BOOL, single bit	Yes	No
.DN	BOOL, single bit	Yes	No

# Addressing

You can address every variable with a basic data type, using its symbol name. Basic data in a user defined structure can be addressed. Single item belonging to an array can be addressed using its index within square brackets.

Examples	
variable	myVariable
structure	structure.element.data - libab_TIMERS[0].PRE - libab_COUNTERS[1].CU
item array	myVariable[2] – srtucture.element[0]

Variable type	Туре	PLC type	Items		
Boolean The number of items used declaring TAGs, must be multiple of source PLC data size. Every group of booleans, must start from the first bit.					
Single bit	Bit	BOOL, SINT, INT, DINT	(C)		
Byte					
Unsigned 8 bit	UInt8		(C)		
Signed 8 bit	Int8	51111			
16 bit					
Unsigned integer 16 bit	UInt16	CINT INT	(C)		
Signed integer 16 bit	Int16	51117, 1111			
32 bit					
Unsigned integer 32 bit	UInt32		(C)		
Signed integer 32 bit	Int32	SINT, INT, DINT,			
Single precision 32 bit - ( IEEE 754 )	Float				
64 bit					
Unsigned integer 64 bit	UInt64		(C)		
Signed integer 64 bit	Int64	SINI, INI, DINI, REAL			
Double precision 64 bit - ( IEEE 754 )	Double				
Strings The number of items used declaring TAGs, must be a multiples of source PLC data size String bytes can be interpreted as ASCII, UTF-7, UTF-8, UTF-16 or UTF-32 encoding					
Array of bytes	String	SINT, INT	(A, C)		
Array of bytes. (Siemens S7)	S7String	SINT, INT	(B, C)		
Array of bytes. (AllenBradley style)	ABString	STRING	single		
<ul> <li>(A) It depends on the string's length:</li> <li>e.g. if you want to read strings with a length of 10 chars each string, you can set a number of items of 74 / 10 = 7 consecutive items.</li> </ul>					
(B) It depends on the string's length: e.g. if you want to read strings with a length of 10 chars each string, you can set a number of items of 74 / $(10+2) = 6$ consecutive items.					
(C) It depends on PLC model. The best way is to try with the maximum items you need.					

## S7 strings format

They have got two bytes at the beginning.

The first byte is for max allowed string length, the second one is for the real string length. These types of strings can be declared with a length of 255 bytes max.

## **AB Strings format**

This kind of string format permits to read and write single text defined as STRING data type into the PLC. STRING Data type is a structure with these two elements: .DATA and .LEN

## **Consecutive items**

The number of consecutive read/write items, depends on the PLC model.

Please review 'Implemented data types' to better understand which types of basic object can be addressed using array of items.
